## 2018 Skill Module Catalog

### Table of Contents by Discipline:

Gas Processing.....	2
Geology .....	7
Geophysics .....	9
Introductory and Multi-Discipline.....	13
Petrophysics .....	17
Process Safety.....	20
Production and Completion.....	24
Reservoir Engineering.....	37
Well Construction/Drilling .....	46

### Definitions of Skill Module Levels

**Core** = Awareness Competency Level, completely self-paced online activities, no instructor-led component.

**Fundamental** = Fundamental Competency Level, mixture of both self-paced online activities and instructor-led virtual sessions. See "Instructor-Led Virtual Sessions" for schedule.

**Workshop** = Skilled Application Competency Level, primarily instructor-led virtual sessions with online activities designed to teach skills necessary for a specific work product.

v.12 March 1, 2018

## Gas Processing

GAS-HCP-1				GAS-IGC-1				GAS-QPB-1			
Hydrocarbon Components and Physical Properties Core				Introduction to Production and Gas Processing Facilities Core				Qualitative Phase Behavior and Vapor Liquid Equilibrium Core			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	4 hrs 45 min		Released	Core	4 hrs 16 min		Released	Core	4 hrs 35 min	
<p>This skill module describes the basic terminology and hydrocarbon nomenclature commonly used in the oil and gas industry. This skill module also explains methods used to determine hydrocarbon fluid composition and approaches to and implications of the characterization of heavy hydrocarbons (C6+) in mixtures. This module also demonstrates how to estimate hydrocarbon physical properties (density and viscosity) for both liquids and vapors, including their purpose and use as applied in facilities engineering calculations.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe the concept of atomic mass, molecular mass, and the mol</li> <li>Identify the four main hydrocarbon groups</li> <li>Practice the concept of relative density</li> <li>Discuss how a gas chromatograph works, the limitations of various analysis methods, and the difference between an extended analysis and a standard gas chromatographic analysis</li> <li>Recognize the uncertainties involved with characterizing the C6+ components in a natural gas, condensate or crude oil stream, and describe the relationship of these factors with hydrocarbon liquid composition</li> <li>Describe an Equation of State, its purpose and uses</li> <li>Define standard (normal) conditions for SI and FPS units, and calculate the molar volume at these conditions</li> <li>Describe the gas compressibility factor and use it to calculate gas density</li> <li>Define the property “viscosity”, list applications where it is used, and describe correlations that can be used to predict its value</li> <li>Estimate the density of a hydrocarbon liquid at a specified temperature and pressure</li> </ul>				<p>This module provides an overview of production and gas processing facilities. The concepts addressed in this module include: 1) the crude oil and natural gas value chains, 2) common contaminants in production streams, 3) crude oil, produced water and natural gas quality specifications, 4) typical production facility and gas processing schemes, and 5) NGL products the economics of their recovery. Knowledge of these basic concepts is critical to understanding the selection and specification of processing facilities between the wellhead and product markets.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>State typical crude oil and produced water specifications</li> <li>Describe process flows for each stream in production facilities</li> <li>List problems associated with and strategies to deal with solids production, e.g. sand, wax, asphaltenes</li> <li>List the components, including contaminants, found in produced gas streams</li> <li>State typical natural gas sales or transportation specifications</li> <li>Calculate higher heating value and Wobbe number</li> <li>List the products of a typical natural gas processing plant, their associated markets, and describe common terminology</li> <li>Describe typical process flows for each stream in gas processing facilities</li> <li>Explain the difference between gas conditioning to meet a HCDP specification and gas processing to recover NGLs</li> <li>Describe shrinkage and how it is calculated</li> </ul>				<p>This skill module describes the phase or phases that exist at given conditions of pressure and temperature of single and multi-component systems. The skill module also explains the concepts of critical point, cricondenterm, cricondenbar, dense phase, and retrograde condensation. In addition, the module explains how to perform bubble point, dew point, and flash calculations, and describes how to stabilize hydrocarbon liquids using stage separation.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe pure component phase behavior</li> <li>Describe multicomponent phase behavior and phase envelopes</li> <li>Define critical point, cricondenterm, cricondenbar, dense phase, and retrograde condensation</li> <li>Summarize the effect of C6+ characterization on the shape of the phase envelope</li> <li>Recognize the effect of various non-hydrocarbon components on the shape of the phase envelope</li> <li>List examples of fundamental applications of phase envelopes in facilities design and operations</li> <li>Explain the concept of equilibrium vaporization ratio, K</li> <li>List the common methods of estimating K values</li> <li>Describe flash, bubble point, and dew point calculations and list examples of their application</li> <li>Describe the effect of composition on bubble point, dew point, and flash calculations for a hydrocarbon mixture</li> <li>Describe stabilization of hydrocarbon liquids using stage separation</li> <li>Summarize the differences between Reid Vapor Pressure (RVP) and True Vapor Pressure (TVP)</li> </ul>			

GAS-WHP-1				GAS-TAE-1				GAS-FFC-1			
Water/Hydrocarbon Phase Behavior Core				Thermodynamics and Applications of Energy Balances Core				Fluid Flow Core			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	6 hrs	GAS-QPB-1	Released	Core	3 hrs 15 min		Released	Core	5 hrs 5 min	
<p>This skill module describes hydrates, explores conditions favoring hydrate formation, and discusses how to prevent hydrates from forming. The skill module also describes how to estimate the hydrate formation temperature of a natural gas stream and the key differences between low dosage hydrate inhibitors and thermodynamic inhibitors.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How to:</p> <ul style="list-style-type: none"> <li>Estimate the water content of sweet and sour natural gas</li> <li>Describe the conditions that favor hydrate formation</li> <li>Estimate the hydrate formation temperature of a natural gas stream</li> <li>Compare and contrast the use of MeOH and MEG to prevent hydrate formation</li> <li>Describe the differences between low dosage hydrate inhibitors and thermodynamic inhibitors</li> </ul>				<p>This module provides an overview of the concepts of thermodynamics, which is the foundation for all processing calculations. This module explains the first and second law of thermodynamics and their application in facilities. Also covered are applications of energy balance equations, the concepts of enthalpy and entropy, and an explanation of how to use P-H diagrams to perform calculations on a simple refrigeration system.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Define the terms system and surroundings and explain the difference between open and closed systems</li> <li>State the first law of thermodynamics and how it is applied to facilities</li> <li>Describe the second law of thermodynamics, and explain how it is applied to facilities</li> <li>Write the energy balance equations for a heat exchanger, valve, separator, and compressor</li> <li>Calculate the duty of a heat exchanger where no phase change occurs and also for an exchanger where a phase change does occur</li> <li>List methods used to estimate enthalpy and entropy</li> <li>Describe a P-H diagram and use it to perform calculations on a simple refrigeration system</li> </ul>				<p>This module discusses the flow of fluid through a pipe segment. Single phase and multiphase flow are explored. In addition, simple correlations are used to estimate important fluid flow parameters.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Explain Bernoulli's equation, including how to estimate and apply the friction factor</li> <li>Describe the difference between Newtonian and non-Newtonian fluids</li> <li>Explain economic pipe diameter and describe typical velocity and pressure drop guidelines for sizing piping systems</li> <li>Calculate fluid velocity and estimate the pressure drop in a plant piping system using simple correlations</li> <li>Describe common gas transmission pipeline flow correlations and their applications</li> <li>Describe the parameters that affect heat transfer for various piping systems</li> <li>Describe the most common flow regimes in multiphase flow systems</li> <li>Explain the difference between liquid hold-up and liquid volume fraction and list factors that affect their value</li> <li>Describe common slugging mechanisms and list methods to limit or reduce the impact of slugging events</li> <li>Describe erosional velocity and explain how it can be estimated for various systems</li> </ul>			

GAS-SEC-1				GAS-HTE-1			
Separation Core				Heat Transfer Equipment Core			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	3 hrs 50 min		Released	Core	4 hrs 10 min	
<p>This skill module describes separators, their use and application, in the oil and gas industry. The principle of gas-liquid and oil-water separations are discussed along with separator sizing. This module also explains what are emulsions, how they form, and their influence on separator design. Also discussed are methods and equipment used to destabilize and eliminate emulsions.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe separator applications and common types of separators</li> <li>List the sizing criteria for 2-phase and 3-phase separators</li> <li>Discuss the principles of gas-liquid separation and how they are applied in separator design</li> <li>Describe the effect of inlet piping size and inlet devices on separator sizing</li> <li>List the types of mist extractors and describe typical applications</li> <li>Estimate separator size based on gas-liquid separation criteria</li> <li>Describe emulsions, how they form, and how they influence separator design</li> <li>Discuss how emulsions can be destabilized and eliminated</li> <li>Estimate the size of an oil dehydrator based on liquid-liquid separation criteria</li> </ul>				<p>This module provides an overview of the heat transfer equipment and mechanisms commonly used in the oil and gas industry. The module also provides an overview including advantages, disadvantages, and applications of different types of heat exchangers.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify types of heat exchangers and common applications in oil and gas processing facilities</li> <li>Describe heat transfer mechanisms: conduction, convection, and radiation</li> <li>Define heat transfer coefficient and describe the primary parameters that affect its value</li> <li>Describe the rate equation used to calculate heat transfer area</li> <li>Describe the “effective temperature difference” and explain how it affects heat transfer area</li> <li>Estimate heat transfer surface area required for a heat exchanger application</li> <li>Describe shell and tube exchanger types and applications</li> <li>Describe compact heat exchangers and fired heaters</li> <li>List the four primary process cooling (heat rejection) methods</li> <li>Describe why air-cooled heat exchangers are so frequently used, key operating parameters, and the difference between induced draft and forced draft designs</li> </ul>			

GAS-PCC-1			
Pumps and Compressors Core			
STATUS	LEVEL	DURATION	PRE-REQ.
Released	Core	5 hrs 48 min	
<p>This module provides an overview of types of pumps and the basic principles and criteria that apply to all pumps. The emphasis is on process-type pumps used in surface facilities. The concepts of Cavitation, Net Positive Suction Head Required (NPSHR), and Net Positive Suction Head Available (NPSHA) are also discussed. The second important focus in this module is compressors, including their applications, types, and selection criteria. The module ends with a discussion of the principles of operation of the various types of compressors.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>Identify types of pumps and common applications in oil and gas processing facilities</li> <li>Describe how a pump selection chart can be used to select pump type</li> <li>Explain the relationship between head and pressure</li> <li>Calculate the pump power requirement</li> <li>Describe the differences in performance characteristics of centrifugal and positive displacement pumps</li> <li>Describe cavitation</li> <li>Define NPSHR and NPSHA</li> <li>Explain the principle of operation of a single stage centrifugal pump, and identify the main pump components</li> <li>Describe the system head curve and explain how it affects pump selection</li> <li>Explain the principle of operation of plunger pumps, common configurations, and identify the main pump components</li> <li>Identify types of compressors and common applications in oil and gas processing facilities</li> <li>Describe how a compressor selection chart can be used to select compressor type</li> <li>Explain the relationship between compressor head and pressure</li> <li>Calculate the compressor power requirement</li> <li>Estimate the compressor discharge temperature</li> <li>Explain the principle of operation of a centrifugal compressor, and identify the main compressor components</li> <li>Describe a centrifugal compressor performance curve, and identify and describe the surge line and stonewall</li> <li>Explain the principle of operation of a reciprocating compressor, and identify the main compressor components</li> <li>Explain the principle of operation of a rotary screw compressor, and identify the main compressor components</li> <li>List common drivers used for each compressor type • Explain the relationship between compressor head and pressure</li> <li>Calculate the compressor power requirement</li> <li>Estimate the compressor discharge temperature</li> <li>Explain the principle of operation of a centrifugal compressor, and identify the main compressor components</li> </ul>			

GAS-RNG-1				GAS-CRD-1				GAS-CRA-1			
Refrigeration, NGL Extraction, and Fractionation Core				Contaminant Removal – Gas Dehydration Core				Contaminant Removal – Acid Gas and Mercury Removal Core			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	5 hrs 27 min		Released	Core	4 hrs 37 min		Released	Core	3 hrs 49 min	
<p>This module explains the concepts of mechanical refrigeration, valve and turbine expansion, and NGL extraction systems. The module also explains the process of fractionation in oil and gas operations.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>List the most common applications of refrigeration in oil and gas processing</li> <li>Review the operation of a mechanical refrigeration system, and describe the effect of condenser and chiller temperature on compressor operation and energy consumption</li> <li>Explain why economizers are commonly used in mechanical refrigeration systems</li> <li>Describe factors that are considered in selection of a refrigerant, and explain cascade refrigeration and why it is used</li> <li>Explain the operation of expansion refrigeration processes (valve and turboexpander)</li> <li>List the common process configurations for the different levels of NGL extraction (including HCDP control)</li> <li>Understand the difference between stage separation and fractionation</li> <li>Define relative volatility and how it affects the difficulty of separation</li> <li>Explain how a fractionator (distillation column) separates components, and describe the operation and purpose of the reboiler, condenser, reflux accumulator, and pump</li> <li>List types of internals used in fractionators to achieve mass transfer, and describe their advantages and disadvantages</li> </ul>				<p>This module provides an overview of processes used to dehydrate natural gas with specific emphasis on the following two methods:</p> <ul style="list-style-type: none"> <li>Absorption using glycol dehydration</li> <li>Adsorption using molecular sieve</li> </ul> <p>Designed for</p> <ul style="list-style-type: none"> <li>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</li> </ul> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>List the three most common gas dehydration options used in oil and gas processing</li> <li>Identify typical applications</li> <li>Describe the advantages and disadvantages of each</li> <li>Describe the components and process flow in a typical glycol dehydration unit</li> <li>State the typical TEG circulation ratios for a glycol dehydration system</li> <li>Determine the minimum lean TEG concentration required for a given water removal requirement</li> <li>Calculate the volumetric TEG circulation rate based on a given water removal requirement</li> <li>Describe the effect of the number of trays or height of packing on the contactor performance</li> <li>Describe the sizing parameters for the contactor and regeneration system</li> <li>Describe the co-absorption BTEX, H<sub>2</sub>S, CO<sub>2</sub> and the TEG; and list the methods to mitigate emissions</li> <li>Explain the process of adsorption</li> <li>List the common adsorbents used in gas dehydration</li> <li>Describe the typical adsorption dehydration cycle for a molecular sieve unit</li> <li>Describe the factors that cause the useful capacity of the sieve to be less than the new equilibrium capacity</li> <li>List the parameters that affect the sizing of the adsorber vessels</li> <li>Describe the mol sieve regeneration process and factors that affect its design and operation</li> </ul>				<p>This module explains the processes of removing mercury and acid gases from a natural gas stream. The module also describes the basic amine process flow diagram (PFD) and explains the advantages of using MDEA for removing H<sub>2</sub>S but leaving CO<sub>2</sub> in the gas stream. Also discussed are when to use a Claus sulfur recovery unit (SRU) and a tail-gas-clean-up unit (TGCU) vs. acid gases injection and why liquid product treating may be required.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Explain why mercury is removed from a natural gas stream, and list two common mercury absorbents</li> <li>List the process options for acid gas removal from a natural gas stream</li> <li>Describe a basic amine process flow diagram</li> <li>Estimate the amine circulation rate, regenerator reboiler duty, and circulation pump power for an AGRU</li> <li>State the conditions where a physical solvent may be advantageous over an amine solvent for acid gas removal</li> <li>List examples where it may be advantageous to selectively remove H<sub>2</sub>S from a gas stream but leave some or all of the CO<sub>2</sub> in the gas</li> <li>Describe the process flow diagram for a standard Claus sulfur recovery unit (SRU)</li> <li>Explain why a tail-gas-clean-up unit (TGCU) may be required, and list processes that may be applied</li> <li>Describe why liquid product treating may be required, and provide examples of common processes used</li> <li>List the advantages of acid gas injection over installation of an SRU and TGCU</li> </ul>

<p>This module explains why the vertical resolution of the seismic data is a critical issue and how the resolution is controlled by the propagating wavelet that is generated by the acquisition parameters. The module also discusses the recorded wavelet and its phases and the data display polarity and display conventions.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify why the vertical resolution of the seismic data is a critical issue</li> <li>Explain how the resolution is controlled by the propagating wavelet that is generated by the acquisition parameters</li> <li>Identify the recorded wavelet and its phase</li> <li>Describe the data display polarity and display conventions</li> </ul>				<p>This module explains how velocity can be estimated by the seismic image construction and used as an approximation to derive a depth converted geologic model from time imaged seismic or a depth image seismic. The module also explains how to directly measure depth vs. vertical seismic travel time through Check Shot Surveys and Vertical Seismic Profiles and how vertical seismic profiling can be extended to 2, 3, and even 4 dimensions to tie the other direction of velocity to the seismic image.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify seismic imaging velocities and how they are used to construct the seismic image</li> <li>Describe how imaging velocities are derived from the stacking process</li> <li>Describe velocity spectrum and how it applies to stacking and migrating the data</li> <li>Explain the relationship between depth and time and the ambiguity between the two domains</li> <li>Recognize overpressure in the seismic data</li> <li>Identify the jargon associated with anisotropy</li> <li>Recognize how a vertical seismic profile directly measures the time to depth relationship at various depths in a well bore and how that facilitates tying it into seismic</li> </ul>				<p>This module explains the concept of seismic processing flow and deconvolution. The module also explains what the processors do to produce the seismic image.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe processing flow</li> <li>Explain the concept of deconvolution</li> <li>Identify what the processors do to produce the seismic image</li> </ul>

Released	Core	2 hrs 30 min		Released	Fundamentals	6 hrs 15 min		Released	Core	2 hrs 2 min	
<p>In this module, we will discuss the process of forming the seismic image by migration. There are several ways to migrate the data, including post-stack, pre-stack, time, and depth migration. For this module, Kirchhoff migration is used as a word picture for the process of allowing constructive and destructive interference to build the migrated image. Other methods will be discussed with their pros and cons.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify migrated displays</li> <li>Describe the matrix of "icons" explaining migration in time, depth, pre-stack, and post-stack</li> <li>Explain the relevance of each seismic migration domain</li> <li>Identify the "best" seismic migration domain</li> </ul>				<p>This interpretation exercise incorporates all aspects, from start to finish, in interpreting a 3D data set, including the final conversion to depth. Several discussion points on tying faults and the style of contouring are included.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify the layout of a 3D seismic survey</li> <li>Turn the interpretation into a data reduction process resulting in an interpretation and a structural map originally in time</li> </ul>				<p>This module explains that the effect of hydrocarbons as a pore filling material in our seismic data is at the core of seismic interpretation. This module also includes a section on rock physics.</p> <p>Designed for</p> <p>Geoscientists, engineers, team leaders, geoscience technicians, asset managers, and anyone involved in using seismic data that needs to understand and use this data at a basic level or to communicate with others that use it.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Explain the effect of hydrocarbons in the seismic data</li> <li>Detect hydrocarbons in the seismic data</li> <li>Describe rock physics</li> </ul>

Released	Core	3 hrs 16 min		Released	Core	2 hrs 37 min		Released	Core	4 hrs 5 min	
<p>Drilling fluids impact all aspects of the drilling operation, including drilling the formations, maintaining a clean and stable wellbore, gathering data from the wellbore, and maximizing productivity of the hydrocarbon resource. Proper selection of a drilling fluid can allow optimum performance in each of these areas. Fluid processing solids control allows cost-effective maintenance of fluid properties. This module addresses these topics at a core level.</p> <p>Designed for</p> <p>Technical staff, business professionals, technicians, analysts and other non-technical staff who are involved with but have limited experience with drilling operations.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Identify functions of drilling fluids</li> <li>Explain fluid types and their selection criteria</li> <li>Identify fluid properties, how they are measured, and additives used to control them</li> <li>Explain benefits of solids control, solids control equipment function, and system configuration</li> </ul>				<p>Directional drilling may be considered the "intentional, controlled deflection of a wellbore to intersect pre-determined targets." In the early days when wooden derricks were erected so close that they touched each other, wellbores that were believed to be vertical occasionally intersected nearby wellbores, proving that the wells were in fact deviating from vertical. This was not directional drilling because this behavior was neither intentional nor controlled. Modern directional drilling is based on an understanding of the reservoir and how the wellbore should be constructed for its proper placement in the reservoir for optimum productivity.</p> <p>Designed for</p> <p>Technical staff, business professionals, technicians, analysts and other non-technical staff who are involved with but have limited experience with drilling operations.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe the objectives of directional drilling</li> <li>Recognize trajectory design options and selection criteria for given surface and downhole requirements</li> <li>Clarify trajectory measurement and wellbore position calculation techniques and limitations</li> </ul>				<p>In this module, you will learn about asset life cycle economics and the phases of the asset life cycle, including exploration; appraisal; development; and production, including mature production and enhanced oil recovery. You will also learn about the historical, geographical, and modern context of the petroleum industry; its organization, the petroleum value chain; and economic drivers.</p> <p>Designed for</p> <p>This module is appropriate for those who need to achieve a context and understanding of E&amp;P technologies, or the role of technical departments in oil and gas operations, and/or be able to understand and use the language of the oilfield.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>Historical petroleum occurrences and usage</li> <li>The phases of the E&amp;P asset life cycle</li> <li>The objectives and processes of the exploration phase of the E&amp;P asset life cycle</li> <li>The objectives, processes, and economic metrics of the appraisal phase of the E&amp;P asset life cycle</li> <li>The objectives and processes involved in the development and production phase of the E&amp;P asset life cycle</li> <li>The objectives and processes involved in the mature production phase in the E&amp;P asset life cycle</li> <li>Basic reserves and production value concepts</li> </ul> <p>Skill Module Content</p> <ul style="list-style-type: none"> <li>The Petroleum Industry – Past to Present</li> <li>Introduction to the Asset Life Cycle</li> <li>Economic Drivers</li> </ul>

Released	Core	3 hrs 52 min		Released	Core	2 hrs 40 min		Released	Core	2 hrs 5 min	
<p>This module is an introduction to Petrophysical Evaluation which integrates the concepts and data covered in the previous modules. The porosity and resistivity data are used in the saturation model to calculate oil and gas saturations. By integrating the available mudlog, core and open hole log data, the Petrophysicist determines net pay, net to gross, porosity, and hydrocarbon saturations. These are required inputs to the Geologic (Static) model used to calculate hydrocarbon volumes in the subsurface. Also, the petrophysical evaluation data including permeability is required input into the reservoir dynamic model that is used to plan development wells and facilities and optimize production of oil and gas reservoirs.</p> <p>Designed for</p> <ul style="list-style-type: none"> <li>Geoscientists and engineers who desire a working knowledge of Petrophysics and hydrocarbon evaluation</li> <li>Other technical staff and non-technical staff (e.g., management, drilling operations, technical support staff, finance, legal, IT, supply chain management, and others) at all experience levels desiring a basic background in the petrophysics discipline</li> <li>Ideal for Service Company and Government employees working with the E&amp;P Industry</li> <li>This module lays the foundation for effective communications between the Subsurface Team and everyone in the E&amp;P Industry</li> </ul> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>How to perform a basic petrophysical evaluation that incorporates Gamma Ray, SP, porosity, and resistivity data</li> <li>About the borehole and formation environment and the parameters required for saturation determination</li> <li>About the Archie Equations and how to calculate water saturations in any interval of interest</li> <li>About the effect of clay minerals on formation resistivity</li> <li>About the shaly sand equations used to calculate saturations in shaly sands</li> <li>About how to conduct an integrated formation evaluation</li> </ul> <p>Skill Module Content</p> <ul style="list-style-type: none"> <li>What Is Petrophysical Evaluation?</li> <li>Understanding Reservoir Saturation</li> <li>Net Reservoir, Net Pay, and N/G</li> <li>Porosity and Quick-Look Petrophysics</li> <li>Resistivity, Archie, and Saturation Determination</li> <li>Petrophysical Evaluation Approach</li> <li>Saturation Models in Shaly Sands</li> </ul>				<p>This module introduces the purpose of, processes, and tools for basic core measurements and special core measurements; and overviews Petrography and Mineralogy Data from cores as well as unconventional core analysis.</p> <p>Designed for</p> <p>Geoscientists and engineers with less than twelve months' experience using petrophysical data and other technical staff at all experience levels wanting a fundamental background in the petrophysics discipline.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Outline techniques for measurement of porosity, permeability, and saturation from cores</li> <li>Identify rules for cutting core plugs, cleaning, and preparing</li> <li>Define special core analysis and its application to petrophysics</li> <li>Explain the usage of special core analysis to determine electrical properties (m, n, Qv) and procedures to assure quality</li> <li>Describe the importance of capillary pressure and wettability; how special core analysis can determine relative permeability curves and residual saturations</li> <li>Explain basic concepts of thin section, SEM, and X-ray diffraction</li> <li>Describe scanning electron microscopy's purpose</li> <li>Define terms of core analysis, the mineralogy of the rocks, and differences when taking measurements</li> <li>Identify differences between unconventional and routine measurements and know when to apply each</li> <li>Define TOC, Maturity, and Kerogen type of source rocks</li> </ul>				<p>This module introduces Nuclear Magnetic Resonance (NMR) Logging, interpretation of Borehole Images and Dip Meter Data, and how permeability is measured in both logs and cores. The module covers NMR logging principles and interpretation and the importance and application of borehole image and dipmeter data.</p> <p>Designed for</p> <p>Geoscientists and engineers with less than twelve months experience using petrophysical data and other technical staff at all experience levels wanting a fundamental background in the petrophysics discipline.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe NMR principles: proton recession and T1 and T2 relaxation in porous media</li> <li>Describe the NMR response to pore size, free fluid, trapped water, permeability, and water cut</li> <li>Characterize tool models, similarities, differences, and operational issues</li> <li>Define NMR permeability determination and bound water vs. free water</li> <li>Describe NMR saturation techniques and interpretation, including appropriate applications and limitations</li> <li>Determine permeability from conventional wireline logs</li> <li>Estimate permeability from empirical relationships</li> <li>Apply specialized tools, such as NMR and acoustic logs to estimate permeability</li> <li>Determine permeability from cores</li> </ul>

<p>The term “Unconventional Resources” cuts a wide swath and encompasses many different and unrelated hydrocarbon resources. They have constituted a small but relevant segment of the oil and gas industry for many decades. However, since only about 1998, with the development of shale drilling and completion methodologies, have Unconventionals become front page news. Although most relevant in North America, shale plays are being probed and tested in many regions of the world.</p> <p>This PetroSkills PetroAcademy skill module addresses both the completion process and the physical completion design of unconventional shale wells at the core level. The strongest focus of the module is on horizontal shale wells but also includes a section on Coalbed Methane and one on Heavy Oil as well.</p> <p>Designed for</p> <p>Production Operations Staff, Reservoir Engineers, Facilities Staff Drilling and Completion Engineers, Geoscientists, Field Supervisors and Managers, Field Technicians, Service Company Engineers and Managers.</p> <p>You Will Learn</p> <p>We will cover the following objectives in this course:</p> <ul style="list-style-type: none"> <li>Describe the purpose and basic operational aspects of wellhead and flow control equipment in wells in unconventional plays</li> <li>Describe the purpose of each of the major components used in a basic well completion in unconventional resources plays, and the impact that drilling practices have on reservoir productivity</li> <li>Describe the function and limitations of each surface and subsurface component of a basic onshore completion in unconventional resources plays</li> <li>Describe the basic properties of completion components materials and their limitations in unconventional resources plays</li> <li>Describe which fluid systems are the most important for implementing successful completions and workovers in wells in unconventional resources plays</li> <li>Describe the most relevant steps for implementing completion procedures in wells in unconventional resources plays, and the proper interaction with all parties involved required</li> <li>Describe the most common techniques used to drill, complete, stimulate, and produce typical wells in coalbed methane reservoirs</li> </ul>				<p>This module presents an overview of the planning and execution required to achieve the quality primary cementing of well casing strings to successfully isolate a wellbore’s geological column, including the well’s productive zone(s). Equipment and cement displacement practices are illustrated and described as well as methods to assess the resultant cement sheath surrounding casing following a cementing job. Preliminary lab work to formulate primary cement blends is described. And, various methods are presented in the remedial repair of poorly cemented zones which can lead to life of the well production problems. Several different cement squeeze techniques are explained and recommended practices are described.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>The manufacturing processes to blend composite materials that make up oilfield cement</li> <li>The various uses of additives to modify cement properties</li> <li>The cementing tools at the surface and downhole and the related cement displacement process to achieve a quality primary cement job to isolate a casing string</li> <li>The casing cement evaluation tools and methods to assess cement job quality</li> <li>The various practices that comprise options to attempt repair of primary cementing jobs that are referred to as cement squeeze operations</li> <li>How to calculate typical casing string cement volume requirements</li> <li>How to evaluate a cement bond log and make recommendations</li> </ul> <p>Skill Module Content</p> <ul style="list-style-type: none"> <li>Oilfield Cement Properties, Additives and Composition</li> <li>Cementing Equipment, Practices and Displacement</li> <li>Primary Cementing Results – Evaluation, Special Cases and Pitfalls</li> <li>Remedial and Squeeze Cementing</li> </ul>				<p>This module illustrates the tools and processes for establishing communication between a well and the productive formation(s) accessed by the well. The evolution of shaped charges is presented and the means for delivering perforating charges into a well using various gun configurations is illustrated. The importance of understanding charge performance to select the appropriate charge for a particular set of well conditions is discussed.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>The various shaped charges, their design, performance, shot phasing and shot density options, and their advantages and limitations</li> <li>The three primary perforating gun conveyance systems and the various gun types available and their individual features</li> <li>Concepts like perforation tunnel damage, gun standoff, underbalance, gun correlation on depth, and other engineering input requirements for each perforation job design</li> </ul> <p>Skill Module Content</p> <ul style="list-style-type: none"> <li>Shaped Charge</li> <li>Perforating Safety</li> <li>Tubing Conveyed Perforating</li> <li>Underbalanced Perforating</li> </ul>

<p>This module will specifically describe the engineering design and operational requirements of Rod Pump, Progressing Cavity Pump (PCP), Jet Pump, and Plunger Lift well completions types.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in production engineering.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>• How to evaluate reservoir and well conditions to choose the appropriate artificial lift system for each set of conditions</li> <li>• How rod pump, PCP pump, jet pump, and plunger lift artificial lift systems work</li> <li>• How to design and optimize rod pump, PCP pump, jet pump, and plunger lift completions</li> <li>• Why surveillance and monitoring of artificial lift systems is essential</li> <li>• Various API and related design standards and practices that represent key, proven artificial lift system performance fundamentals</li> </ul> <p>Prerequisite</p> <p>It is recommended that the learner have previous knowledge of basic Inflow and Outflow concepts and related NodalTM Analysis principles and applications. The "Production Principles Basics" module covers Inflow and Outflow at the basic competency level.</p> <p>Skill Module Content</p> <p>This module provides an overview of proven basic principles: to design rod pump, PCP pump, jet pump, and plunger lift artificial lift systems to optimize production and recovery. Each of these artificial lift types have specific operating characteristics that are available to apply to operate appropriate candidate wells. Each will be examined using theory, videos and animations, and exercises to study and evaluate when and how to select these differing artificial lift systems for unique completion conditions. Oil recovery and gas well de-watering principles using appropriate artificial lift systems are described. Conventional and unconventional reservoir applications are cited.</p>				<p>About the Skill Module</p> <p>This module focuses upon the three main components of a rod pump well completion, namely, the surface unit, the rod string, and the downhole pump. Each component is examined and investigated to define the rod pump completion loading parameters. Related rod pump design considerations necessary for optimizing rod pump design and operation are presented. Different types of surface unit configuration geometries are presented and the positives and negative attributes of each are presented. The API rod string design method is reviewed and two rod string designs are then conducted as exercises. Rod pump completion design problems are worked which include the selection of several input variables. Rod string metallurgy options are discussed and both fiberglass rods and continuous rods are illustrated, again with positive and negative considerations of each. The setup, operation, and interpretation of the surface dynamometer data gathering tool and its overall information gathering function is worked in exercises. Throughout the module, rod pump optimization concepts are presented. And lastly, the importance of computer software programs in designing and optimizing rod pump operations to accommodate rod string loads and metallurgy and fluid inertia factors is emphasized.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>• Apply the working principles and operating characteristics of oilfield reciprocating rod pump artificial lift technology</li> <li>• Employ the steps necessary to design, maintain, and service rod pump surface unit equipment</li> <li>• Employ the steps necessary to design, maintain, and service rod pump rod strings</li> <li>• Employ the steps necessary to design, maintain, and service rod pump downhole pumps</li> <li>• Develop engineering and operating skills to successfully design, properly set up, maintain, and provide overall service for implementing and applying reciprocating rod pump artificial lift technology</li> <li>• Illustrate using pictures, animations, sketches, design software, and other media and tools the key mechanisms of rod pump systems</li> <li>• Design a rod pump rod string using the Modified Goodman method</li> <li>• Highlight the considerations and adjustments being reviewed by API regarding standards for proper consideration of rod fatigue and related corrosion effects upon rod string design</li> <li>• Work several rod pump design exercises to assess maximum and minimum pump load, minimum and maximum rod stress, motor selection, strokes per minute, stroke length, and related overall rod pump design parameter selection</li> <li>• Describe how a rod pump surface dynamometer gathers rod pump loading data over each pump cycle, calculate maximum and minimum rod stress loading, predict downhole pump performance, select rod string taper sizing, select motor horsepower required, and evaluate overall pump performance while identifying rod pump problems, all using a rod pump dynamometer, known as The Analytic and Predictive Tool for reciprocating rod pumps</li> <li>• Outline the primary causes of rod failure and how the use of rod guides and other auxiliary equipment can mitigate failures, the effect of gear box overload and how to prevent it, the proper selection of rod metallurgy for corrosion conditions, and the need for disciplined inspection of well tubing and rods to minimize failures</li> <li>• Demonstrate how the use of modern instrumentation "smart well" systems to control pump operation, gather data, and manage pump functions results in optimum pump performance and minimized costs</li> </ul>

Formation Damage and Matrix Stimulation Core				Formation Damage and Matrix Acidizing Fundamentals			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	2 hrs 36 min	PCE-PEC-1	Released	Fundamentals	9 hrs 40 min	PCE-FDC-1
<p>This module clarifies from the outset that an unexpected loss of production following initial completion or a well intervention job is not always due to the same set of circumstances. Production not achieved when placing a new well on production may be a result of the original depositional environment that occurred. Or, it may be a result of drilling damage, dirty completion fluids or other phenomena that the engineer must properly identify to correct the production shortfall anomaly, if possible. Matrix acidizing chemistry is explained and the different steps taken when acidizing a limestone compared to a sandstone are explained. Related acidizing topics like diverting agents and their function, corrosion inhibitors, and well acidizing candidate selection are addressed.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>• The basic causes of oilfield formation damage and how they are recognized</li> <li>• The concept of “True Formation Damage” and the principles of formation remediation once it has been correctly identified as being the cause of lost production</li> <li>• How “pseudo” damage and differs from True Formation Damage</li> <li>• The principles of limestone matrix acidizing and the chemistry and reactions involved</li> <li>• The principles of sandstone matrix acidizing and the chemistry and reactions involved</li> <li>• Formation damage identification and the positive results achieved by successfully conducting matrix acidizing jobs</li> </ul>				<p>About this Skill Module</p> <p>The module addresses the complex oilfield phenomena that studies and attempts to resolve the varied causes of oil and gas production shortfalls. Production loss or less than expected production rate following initial completion or any well workover or intervention activity is often not only unexpected but also commercially penalizing as a result of lost production revenue. Formation damage is a term used to describe the cause of production loss. And, its use is a commonly misunderstood, misused, or distorted term. Production loss may be a result of many factors and circumstances, often either related or unrelated to one another, some due to natural depositional causes and others as a result of flawed or less than ideal operations conducted within the well to which the producing zone is exposed. The set of circumstances referred to as “True” Formation Damage is described in detail. It is demonstrated that production loss caused by these circumstances may often be remediated, as long as causes are properly defined and correct, and appropriate remedial steps are taken with specific attention to detail. Other causes of production shortfall, also grouped into the formation damage term to describe lost production, are identified in the module along with recommended remedial steps to address them. Use of the reservoir engineering term “skin” is explained and quantified in the module. Skin is described as the sum of related unwanted, individual pressure drops in a producing system that cause lost or reduced production. Once production loss causes are properly identified, certain types of causes may be resolved and production restored using principles of matrix acidizing and surfactant chemistry, acid job pumped at pressure below formation fracture pressure. Acid pumping schedules with related surface active agent chemical substances which react certain sources of formation damage are explained; related acidizing options and practices within an acid pumping schedule are developed. Oil and gas reservoirs most susceptible to formation damage that may be remediated are sandstones and limestone. Acid stimulation of both are described in detail. The complex reactions that take place using a Hydrofluoric acid / Hydrochloric acid on sandstones (referred to as “Mud Acid”) to remove production loss causing damage are described in detail. And, these are compared to the lesser complex use of Hydrochloric acid to react limestones to remove production loss causing damage. Fracture acidizing of limestones by pumping acid above fracture pressure are explained and examples illustrated. Corrosion inhibition, acid additives, iron control acid diversion, and related important topics are addressed and explained. A classic oilfield service company video explaining formation damage and acidizing is available to view. Several practical exercises are worked to illustrate key module principles.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>• Illustrate the impact of formation damage upon production</li> <li>• Explain the wide variety of reasons, sources, depositional environments, and routine operations’ activities that result in production limitations</li> <li>• Assess formation damage “skin” values</li> <li>• Calculate production rates with various levels of formation damage as well as no formation damage</li> <li>• Describe how TFD is recognized and how PD is recognized and present the characteristics and elements of each</li> <li>• Illustrate clay stabilization through the use of positively charged cation exchange to stabilize negatively charged clays to limit clay migration, hydration, and other damaging mechanisms</li> </ul>

<p>This module begins by discussing both the causes of sand production, and the effects that sand production can have on our oil and gas wells. The subsequent sections describe the methods and the equipment used to control sand production. All of the major types of sand control completions are discussed, along with their strengths, weaknesses and the conditions under which they can be applied. Many new technologies have been introduced in the last several years, such as FracPacking and Expandable Screens. This module will discuss several that have been successfully applied. We will also discuss many of the more common problems encountered, and how to avoid these problems.</p> <p>Designed for</p> <p>Petroleum engineers, production operations staff, reservoir engineers, facilities staff, drilling and completion engineers, geologists, field supervisors and managers, field technicians, service company engineers and managers, and especially engineers starting a work assignment in production engineering and operations or other engineers seeking a well-rounded foundation in artificial lift design and operations.</p> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>• Outline the completion options for sand control</li> <li>• Recognize completions with no direct downhole mechanical control devices</li> <li>• Identify equipment installed downhole to control the sand</li> <li>• Describe chemical methods to control sand production</li> <li>• Describe many different types of screen designs used in sand control completions, with or without a gravel pack</li> <li>• Describe the use of gravel packs in both open hole and cased hole completions</li> <li>• Determine formation sand size distribution and why it is required to perform a successful gravel pack</li> <li>• Describe the completion equipment required to place a tight gravel pack in a well</li> <li>• Recognize the importance of using clean fluids to place the gravel</li> <li>• Recognize the benefits of using horizontal wells to reduce sand production and improve well productivity</li> <li>• Describe how to gravel pack horizontal wells using brines or gels</li> <li>• Describe how alternate path technology can be used to ensure successful gravel packs when using gel carrier fluids</li> <li>• Identify the common mistakes that reduce productivity in gravel packed wells</li> <li>• Recognize how the use of fluid loss control materials can lead to positive skins for wells</li> <li>• Outline how Darcy's law calculations are used to determine the effects of a positive skin</li> <li>• Evaluate the use of expandable screens as a sandface completion method</li> <li>• Describe the limitations of expandable screens</li> <li>• Outline the benefits of fracpacking wells as a sand control completion method</li> <li>• Describe how fracpacks improve well productivity, compared to most other completion methods</li> <li>• Outline how to apply a fracpack completion</li> <li>• Outline the benefits of screenless fracpacks</li> <li>• Describe fracpacking horizontal wells</li> </ul>				<p>The reality is that the industry began fracking conventional gas wells in 1947 in the Hugoton Field in southwest Kansas. What is relatively new is the technology and tools which allow us to place multiple hydraulic fracture stimulations along a single lateral in a horizontally drilled unconventional well.</p> <p>The hydraulic fracturing course covers basic rock mechanics, stimulation design considerations, and optimum fracture length at the core level. It covers both fracture acidizing and propped hydraulic stimulations. It reviews propped hydraulic fracturing for both the conventional sandstone reservoirs and unconventional shale reservoirs and explains why the techniques are different.</p> <p>Designed for</p> <p>Production Operations Staff, Reservoir Engineers, Facilities Staff Drilling and Completion Engineers, Geoscientists, Field Supervisors and Managers, Field Technicians, Service Company Engineers and Managers</p> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>• Describe the significance of rock mechanics in all relevant production engineering operations</li> <li>• Describe the most common non-chemical stimulation methods, their objectives and limitations in conventional resources plays</li> <li>• Describe the most common non-chemical stimulation methods, their objectives and limitations in unconventional resources plays</li> <li>• Describe the basic principles of hydraulic fracturing in conventional plays, the difference between acid and proppant treatments, and how to select optimum stimulation candidates</li> <li>• Describe the basic principles of hydraulic fracturing in unconventional resource plays, the difference between slickwater and cross-linked treatments, and how to select optimum stimulation candidates</li> </ul>

<p>This skill module will take you through multiple facets of Completion Design Fundamentals. The topics that are covered in this module include an extensive look at conduits, circulating and killing wells, inflow and outflow along with well barriers and well servicing fluids, and a few more.</p> <p>Designed for</p> <ul style="list-style-type: none"> <li>Engineers within the first two years of a completions and/or workover role</li> <li>Production operations staff, Service company engineers and managers</li> <li>Drilling engineers, Reservoir Engineers, Field supervisors and managers</li> <li>Other asset team members who routinely work with completion or workover staff</li> </ul> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>Recognize the various design concepts which will be covered throughout the rest of this module</li> <li>Identify the most common sandface completion options</li> <li>Explain the advantages and disadvantages of each option</li> <li>Describe the different conduit options</li> <li>Explain the benefits or disadvantages of each option</li> <li>Differentiate between “killing” and “offloading” the well</li> <li>Explain the various options for displacement or circulating in a completion</li> <li>Describe the difference between bullheading and circulating</li> <li>Describe where to locate the primary circulating device</li> <li>Differentiate between the various circulating path options</li> <li>Explain the relationship between inflow and outflow</li> <li>Explain how this relationship impacts completion design</li> <li>Describe the most common method of determining inflow – Darcy’s law</li> <li>Define a barrier</li> <li>Explain why barriers are critical to well operations</li> <li>State the normal industry practice for the number of barriers required during an operation</li> <li>Determine a hydrostatic barrier density requirement</li> <li>Describe the functions of well intervention fluids</li> <li>List the main types of completion fluids</li> <li>Describe common additives</li> <li>Differentiate between completion fluids, packer fluids, kill fluids, perforating fluids, and others</li> <li>Explain several of the most important interface points between drilling and completions</li> <li>Describe primary cementing and the impact on the completion</li> <li>Production casing size and the impact on the completion</li> <li>Drill-in fluids, and their impact on the completion</li> <li>Identify and explain trajectories</li> <li>Explain the typical spacing of many oilfield components used in a completion</li> <li>Identify common symbols used for oilfield components in a well sketch</li> <li>Critique a well sketch</li> <li>Describe the potential failure mechanisms for metal components</li> <li>Explain the basic principles of corrosion</li> <li>Use a sample metal selection chart to select metals for well conditions</li> <li>Describe selection criteria for elastomers</li> </ul>				<p>This Well Completions Fundamental module covers five sections, including well completion equipment, packers, landing nipple and lock mandrel systems, safety valves, and circulation devices.</p> <p>Designed for</p> <ul style="list-style-type: none"> <li>Engineers within the first two years of a completions and/or workover role</li> <li>Production operations staff</li> <li>Service company engineers and managers</li> <li>Drilling engineers</li> <li>Reservoir Engineers</li> <li>Field supervisors and managers</li> <li>Other asset team members who routinely work with completion or workover staff</li> </ul> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>Identify the functionality linked to downhole equipment</li> <li>Recognize the full suite of equipment to be further covered in this module</li> <li>Describe the difference between wellheads and Christmas trees</li> <li>Describe the functions of a wellhead</li> <li>Analyze a video of a wellhead, identifying the various annuli and various seals</li> <li>Describe the function of a Christmas tree</li> <li>Analyze a video of a Christmas tree video, and identify the various valves and their functions</li> <li>Identify the appropriate API standards to reference</li> <li>Identify the various characteristics of a tubing string, including weight/internal diameter, outside diameter, metallurgy, and associated properties</li> <li>Describe the main differences between API connections and premium connections</li> <li>Explain the results from a torque/turn chart</li> <li>Describe tubing and connection selection criteria</li> <li>Identify the primary function of a packer</li> <li>Identify the significant mechanical components of packers</li> <li>Describe one method of categorizing packers</li> <li>Describe several packer setting methods</li> <li>Explain the main options for connecting the tubing to the packer</li> <li>Describe the physical basis for tubing length changes</li> <li>Calculate a simple tubing length change</li> <li>Describe the components of a landing nipple and lock mandrel system and explain why this system is used</li> <li>Identify the primary function of a safety valve</li> <li>Differentiate between a surface controlled and a subsurface controlled valve</li> <li>Describe the conditions where a safety valve should be placed in the well</li> <li>Describe the operation of a typical sliding side door</li> <li>Explain reasons for including a circulating device</li> <li>Differentiate between circulating points for liquid and those for gas</li> <li>Describe common completion accessories, including wireline re-entry guides, blast joints, and flow couplings</li> <li>Demonstrate uptake of the modules that have been covered up to this point</li> <li>Identify areas requiring review</li> <li>Design a completion, incorporating equipment, reservoir data, fluid data, etc.</li> </ul>

The Role of Production Technology Core				Production Technology Applications Core			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Core	1 hrs 55 min		Released	Core	4 hrs 59 min	
<p>Any oil and gas operation has certain key, fundamental aspects and "things that must happen" for the producing asset to be properly developed or re-developed initially and to continue to perform at its optimum efficiency and profitability throughout its life.</p> <p>Well-defined practices and processes must be put in place. The project team and its cumulative skill set necessary to conceive and execute what must happen are essential and indispensable for any oil and gas industry organization.</p> <p>This PetroSkills PetroAcademy blended skills module addresses the concept of Production Technology and the production technologists who define and implement the details of managing a hydrocarbon asset.</p> <p>Production technologists, or a company's PTs as they are often described or labeled, are subject matter experts (SMEs) across all oilfield disciplines who contribute both formally and semi-formally throughout an asset's life. Their team work and focus continually brings both proven oilfield practices as well as prototype emerging and new technology to fruition in a hydrocarbon exploitation development.</p> <p>This module develops the context of what PTs do, how they interact, how they function in leadership roles, and presents many types of production technology applications that are envisioned, initiated, developed in detail, implemented, and managed.</p> <p>Designed for</p> <p>Exploration and production technical professionals, asset team members, team leaders, line managers, IT department staff who work with data and support production applications, data technicians, executive management, and all support staff who require a more extensive knowledge of production technology and engineering.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Define the oilfield term "Production Technology"</li> <li>Describe the technical qualities and character of subject matter experts in oil and gas organizations who are referred to as "production technologists"</li> <li>List various common responsibilities of an industry "production technologist"</li> <li>Recall two cases of well completion design (one for an unconventional shale well and the other for a conventional sandstone well) and the generic routines that a production technologist might follow in making completion design decisions</li> </ul>				<p>This module addresses selected applications which may be put into practice in designing and operating a hydrocarbon asset.</p> <p>Both conventional limestone and sandstone reservoir examples and situations as well as unconventional shale oil and gas reservoirs and various real world applications are presented for discussion. Among various technologies presented are an overview of subsea development, well completion equipment, smart wells and smart field know-how and hardware and software, expandable tubulars, swellable elastomers, produced water shut off chemistry, surveillance practices, and other contemporary production technology advancements regularly utilized in contemporary developments throughout the oilfield.</p> <p>Designed for</p> <p>Exploration and production technical professionals, asset team members, team leaders, line managers, IT department staff who work with data and support production applications, data technicians, executive management, and all support staff who require a more extensive knowledge of production technology and engineering.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Describe examples of proven, established, historical oilfield industry Production Technology application and practices</li> <li>Describe examples of more recently developed proven, established, oilfield industry Production Technology application and practices</li> <li>Justify establishing superior oilfield data gathering practices and related data quality control, data organization, and data access methods</li> <li>Recall the history of and present day application and advancement of digitalization in the oilfield</li> <li>Explain the diversity of downhole well completion tool applications and the proper selection of completion equipment</li> </ul>

Nodal Analysis Workshop				Scale Identification, Remediation and Prevention Workshop			
STATUS	LEVEL	DURATION	PRE-REQ	STATUS	LEVEL	DURATION	PRE-REQ
Released	Workshop	30 hrs 34 min	PCE-WPN-2	Released	Workshop	15 hrs 48 min	
<p>This workshop will be delivered through PetroSkills PetroAcademy™ providing participants with the requisite knowledge they need through virtual delivery.</p> <p>Well Inflow/ Outflow (NODAL™) Analysis is an integral part of a production or completion engineer’s work scope, and it is often applied throughout a well’s life to maximize value – from the beginning of the completion design process through underperforming well diagnostics. This workshop provides a comprehensive overview of this analysis technique, emphasizing real world application through multiple problems from different perspectives. Upon completion, participants will be able to approach a problem recognizing potential solution methods, prepare data for the analysis, identify sources of error, perform an analysis with industry software, and present a holistic recommendation. Topics related to perforating, components of skin, matching transient test data, outflow limitations, selecting artificial lift, liquid loading, and incorporating fluid PVT properties will be covered.</p> <p>Designed for</p> <p>Operating Company and Service Company Engineers, and Technical Managers, responsible for performing or reviewing well systems analysis from at least one perspective (perforating design, tubing sizing, post stimulation evaluation, etc.). Participants should be in a role that requires that they regularly perform or are required to technically review well inflow/outflow analysis.</p> <p>You Will Learn</p> <p>How To</p> <ul style="list-style-type: none"> <li>Recognize the application, and limitations, of traditional well systems analysis</li> <li>Identify data requirements for a meaningful analysis</li> <li>Accurately model the various components of skin, including perforating</li> <li>Assess outflow performance, including liquid loading, tubing constraints, and artificial lift</li> <li>Confidently approach well systems analysis from multiple perspectives, and select the correct diagnostic strategy for your well conditions</li> </ul>				<p>Scale Identification, Remediation and Prevention is an essential part of a production or workover engineer’s scope of work. This workshop provides a comprehensive overview of dilemmas in operating producing and injection wells relating to the presence of a variety of oilfield scale types – primarily reduction in pipe carry capacity and localization of corrosion attack – deposition mechanisms, identification methods, and various removal techniques and methodologies for its prevention. Upon completion, participants will be aware of the scale problem, understand ways to remediate it, and prevent subsequent deposition. Specific mathematical scale prediction methods are presented and numerous preventive methods, both chemical and unique approaches, are covered.</p> <p>Designed for</p> <p>Asset managers, drilling and completion engineers, petroleum engineers and geologists, independent producers, production managers and engineers, reservoir managers and engineers, field supervisors, company executives and officials, field personnel with operating and service companies. Participants should have at least one year of operations-related experience and be in a supervisory or support role.</p> <p>You Will Learn</p> <p>Participants will be able to recognize the importance of the various scales, appreciate the problems they create, understand how water, pressure, temperature and salinity affect scaling, and know various scale deposition mechanisms. Additionally, they will learn about:</p> <ul style="list-style-type: none"> <li>How to determine scaling potential and the solubility of various scales</li> <li>Two principle methods for scale identification and recognize various methods and their application for removing scale depending on its composition</li> <li>Precipitation tendency variables and locations for various scale deposits – especially iron and be familiar with three mathematical models that predict scaling, including a popular software program</li> <li>How to properly prevent and inhibit scale formation and deposition using various methods</li> </ul>

Released	Workshop	38 hrs 21 min		Released	Core	3 hrs 43 min		Released	Core	4 hrs 50 min	
<p>Casing design is an integral part of a drilling engineer's work scope. This course provides a comprehensive overview of the design process, emphasizing the working stress approach currently used in the industry. On completion of this course, successful participants will be able to select casing points, identify tubular requirements and loads, and design and specify the required casing string. Through a combination of lecture and extensive hands-on examples, the fundamentals of casing design are imparted to the attendees. Estimation of standard and special loads is covered in detail. Standard theories of strength and failure are discussed as well as advanced considerations for combined loads. In addition to safe handling, running and hanging practices are covered. References to be used in this skill module include Dr. Byrom's textbook, "Casing and Liners for Drilling and Completion," and computer spreadsheets to facilitate routine design calculations.</p> <p>Prerequisites:</p> <ul style="list-style-type: none"> <li>Casing Basics</li> <li>Casing Design Fundamentals</li> </ul> <p>Designed for</p> <p>This workshop is designed for engineers, site supervisors, superintendents and managers responsible for casing design and/or review of casing design for the full life cycle of the well including drilling, completion, production, well intervention and abandonment.</p> <p>You Will Learn</p> <ul style="list-style-type: none"> <li>A casing design process applicable to all wells on a global basis</li> <li>The tri-axial casing design approach based on worst case possible combinations will ensure well integrity for the full life cycle of the well</li> <li>The extremes of temperature, pressure and environment will be addressed in bolt-on sessions to the workshop including geothermal, SAGD, HPHT, Deepwater, etc.</li> </ul>				<p>Casing is pipe that goes into the wellbore and stays in the well because the outside of the casing is cemented to the earth which provides wellbore integrity. In other words, casing's primary purpose is to keep the wellbore from caving in or fracturing, to keep unwanted fluids from entering the wellbore, and to keep the desired fluids (hydrocarbons) from leaving the borehole at undesirable places.</p> <p>In this module, you will study five topics:</p> <ul style="list-style-type: none"> <li>The Drilling Process: This topic introduces the process of drilling an oil well, showing how casing, mud, and cement are used</li> <li>API/ISO Standards: This topic overviews the naming conventions for casing. It explains how to identify casing by its properties</li> <li>The Casing Manufacturing Processes: This topic introduces the two major methods of making casing, Seamless and Electric Resistance Weld (ERW). It explains the processes by which both types of casing are made, from generating the steel to the formation of the finished casing products</li> <li>Casing Properties and Dimensions: This topic provides an in-depth explanation of each casing property. It describes, in detail, each dimension listed in the API/ISO naming convention</li> <li>Casing Strings: This topic overviews the four casing strings—conductor, surface, intermediate, and production—and how these casing strings work together in an oil field well</li> </ul> <p>Designed for</p> <ul style="list-style-type: none"> <li>Individuals interested in the basic use of casing in oil fields</li> <li>Members of an extended multidiscipline team</li> </ul> <p>You Will Learn How To</p> <ul style="list-style-type: none"> <li>Describe the purpose of casing in an oilfield well</li> <li>State how joints of casing are connected together</li> <li>Recognize the steps in the process for drilling and cementing casing in an oil/gas well</li> <li>Demonstrate knowledge of the API/ISO casing naming convention</li> <li>Discuss the advantages and disadvantages to casing produced with seamless and ERW properties</li> <li>Identify casing descriptions and dimensions and, when appropriate, describe the correlation between them</li> <li>Identify where the four different casing applications are in a wellbore schematic</li> </ul>				<p>Casing is pipe that goes into the wellbore. Casing stays in the well because the outside of the casing is cemented into the earth, providing wellbore integrity. In other words, the casing's primary purpose is to keep the wellbore from caving in or fracturing, to keep unwanted fluids from entering the wellbore, and to keep the desired fluids (hydrocarbons) from leaving the borehole at undesirable places.</p> <p>In this module, you will study four topics:</p> <ul style="list-style-type: none"> <li>Handling Casing: This topic introduces the process of getting the casing to the rig floor. It explains the concept of stacking casing in reverse order, numbering casing, and the types of casing you will see at an oil rig.</li> <li>Rigging up Casing Running Equipment: This topic overviews the running casing checklist, Job Safety Analysis (JSA) and equipment used for setting casing in a borehole. It explains the purpose and function of spiders, elevators, power tongs, and the stabbing board.</li> <li>Making up the Shoe Track: This topic introduces the shoe track and some of the other pieces of a casing string. It explains the purpose of the float shoe, guide shoe, float collar, thread locking compound, and centralizers.</li> <li>Running Casing: This topic provides an in-depth explanation of running the casing into the borehole. It describes the "dance"—the set of steps and movements of the casing crew that help to get the casing in the borehole quickly, efficiently, and safely.</li> </ul> <p>Designed For</p> <ul style="list-style-type: none"> <li>Individuals interested in the understanding what it takes to run casing</li> <li>Members of an extended multidiscipline team</li> </ul> <p>You Will Learn How To:</p> <ul style="list-style-type: none"> <li>Describe the steps of running casing, from getting the casing to the rig to running the casing into the borehole</li> <li>Determine safe working practices while running casing on a rig</li> <li>Identify responsibilities of and organize all wellsite personnel for normal casing running operations</li> <li>Identify the purpose of the basic running casing equipment and key steps used to run casing</li> </ul>
